# 1 Pcb\_9

This document describes a set of Perl routines that can be used to create component footprints for the circuit board layout program [PCB](#). These routines reside in a file called `Pcb_<n>.pm` where `<n>` is the current revision number of the package. Only the new format of PCB elements is output. The differences (that I am aware of) between the old and new formats are:

- Dimensions are in hundredths of a mil.
- The argument delimiters are square brackets []
- The element command adds the `mark_x` and `mark_y` parameters
- The pin and pad command add clearance and mask parameters.

## Requirements

These routines should run with a standard Perl distribution. The only packages used are `POSIX` and `Carp`.

## Usage

These routines are object oriented. A PCB object is created using `new` and all subsequent method calls use this object. `element_begin` starts a new element. `element_output` outputs the element file. `element_add_mark` sets the component centroid. `element_set_text_xy` sets the text position for the reference designator. The names of the methods used to draw elements all start with the string `element_add`. Arguments for the method calls are key-value pairs. The keys are parameter strings defined in [pcb.html](#).

To use these routines in a Perl script to create a PCB element:

1. Include the PCB routines use `Pcb_<n>`;
2. Create a PCB object using `new`
3. Begin an element using `element_begin`
4. Add copper to the element using `element_add_pin` or `element_add_pad`
5. Add silkscreen elements using `element_add_line`, `element_add_arc`,
6. Mark the centroid using `element_add_mark`. The mark can also be set using parameters of the `element_begin` method.
7. Add the text location for the reference designator using `element_set_text_xy` The text location can also be set using parameters of the `element_begin` method.
8. Output the element to a file using `element_output`

The simple example in [Listing 1](#) creates a quarter watt through-hole resistor. The example in [Listing 3](#) creates a variety of two terminal SMD footprints ranging in size from 0402 to 2512. The example in [Listing 5](#) creates Molex 8624 series header connector footprints. The example in [Listing 6](#) creates TQFN footprints for a variety of Maxim parts. These examples place files in the directory `./tmp`. This can be easily changed by changing the `element_begin` call.

## 2 new

### Usage

```
Pcb_9->new( <parameter list> )
```

### Description

Creates an object that is used to make PCB element files. Default parameters for the various element drawing commands can be initialized using a key-value parameter list. The valid keys and default values are in [Table 1](#)

Parameter Name	Default Value	Notes
line_thickness	10	thickness used in drawing silkscreen lines
arc_thickness	10	thickness used in drawing silkscreen arcs
thickness	10	thickness used in drawing any silkscreen line
pin_flags	0	flags used in creating element pins (See <a href="#">Table 16</a> )
pad_flags	PAD_SQUARE	flags used in creating pads
font_size	50	size in ??? of the silkscreen found
clearance	10	separation of pad from other conductors on the layer .
mask	10	distance between the edge of the solder mask and the copper pad. This definition differs from the <b>PCB</b> definition of mask.
debug	0	debug messages. no messages (0). object methods (1). object methods + internal subroutines (2)

Table 1: Keys for Method new

### Example

To create a new object that will display object method debugging messages:

```
my $Pcb = Pcb_9 -> new(debug => 1);
```

## 3 element\_begin

### Usage

Pcb->element\_begin( *<parameter list>* )

### Description

Initializes a new Pcb element. If an element was previously created but not output a call to `element_begin` will remove it. The valid keys and default values are in [Table 2](#)

Parameter Name	Default Value	Notes
flags	0	Element flags. See <a href="#">Table 13</a>
description	''	Text description of the footprint
layout_name	''	Reference designator used on the PCB.
value	''	Value of component in the PCB. Leave blank.
mark_x	0	X location of the footprint mark (in mils)
mark_y	0	Y location of the footprint mark (in mils)
text_x	0	X location of the refdes text (in mils)
text_y	0	Y location of the refdes text (in mils)
direction	0	Text direction flags. See <a href="#">Table 14</a>
scale	100	Text scale.
text_flags	0	See <a href="#">Table 15</a>
output_file	'PCB_ELEMENT.TMP'	Element filename
pin_one_square	0	Sets a default value that is used when creating a pin.
dim	'mils'	units default to mils

Table 2: Keys for Method `element_begin`

### Example

To begin a 1/4 Watt resistor element with dimension values in mils:

```
$Pcb -> element_begin(description => 'resistor',  
                      output_file => '025W',  
                      dim => 'mils');

## 4 element\_output

### Usage

```
Pcb->element_output( <parameter list> )
```

### Description

`element_output` outputs the element drawing commands to a file. At this time there are no parameters that are valid for the *<parameter list>*.

## 5 element\_add\_line

### Usage

Pcb->element\_add\_line( *parameter list* )

### Description

Creates a silkscreen line of a specified thickness (**thickness**) between two points (**x1, y1**) and (**x2, y2**).

Parameter Name	Default Value	Notes
x1		X coordinate of the first point.
y1		Y coordinate of the first point.
x2		X coordinate of the second point.
y2		Y coordinate of the second point.
thickness		Width of the line.

Table 3: Keys for Method element\_add\_line

### Example

To create a 200mil long silkscreen line that is centered at (0,0) that is 10 mils thick

```
$Pcb -> element_add_line(x1 => -100, y1 => 0,  
                        x2 => 100, y2 => 0,  
                        thickness => 10);
```

## 6 element\_add\_arc

### Usage

```
Pcb->element_add_arc( <parameter list> )
```

### Description

Creates a silkscreen arc with a specified width and length centered at a point (x1, y1).

Parameter Name	Default Value	Notes
x		X coordinate of the point.
y		Y coordinate of the point.
width		horizontal width of the arc
height		vertical length of the arc
start_angle		Starting angle of the arc (degrees)
delta_angle		Angle swept by the arc (degrees)
thickness		line thickness

Table 4: Keys for Method element\_add\_arc

### Example

To create a silkscreen circular arc centered at (0,0) with a line thickness of 10 mils, radius of 200 mils that starts at 45° and sweeps for 135°:

```
$Pcb -> element_add_arc(start_angle => 45,  
                        delta_angle => 135,  
                        x => 0,  
                        y => 0,  
                        width => 200,  
                        height => 200,  
                        thickness => 10);
```

For an ellipse set the width and height to unequal values.

## 7 element\_add\_pin

### Usage

```
Pcb->element_add_pin( <parameter list> )
```

### Description

Adds a pin to an element

Parameter Name	Default Value	Notes
x		X coordinate of the point.
y		Y coordinate of the point.
thickness		width of the copper pad
clearance		separation of pad from other conductors on the layer .
mask		distance between the edge of the solder mask and the copper pad. This definition differs from the <b>PCB</b> definition of mask.
drill_hole		diameter of the hole that is drilled at the center of the pad
name		string
pin_number		The pin number of the component pin that will inserted at this position.
flags		See <a href="#">Table 16</a>

Table 5: Keys for Method element\_add\_pin

### Example

To place a pin with a round pad at (-100,0) with a pad diameter of 55 mils, a drill hole diameter of 35 mils, soldermask clearance of 10 mils, a copper clearance of 9 mils, and a pin number of one:

```
$Pcb -> element_add_pin(x => -100, y => 0,  
                        thickness => 55,  
                        drill_hole => 35,  
                        mask => 10,  
                        clearance => 9,  
                        pin_number => 1);

## 8 element\_add\_pad

### Usage

```
Pcb->element_add_pad( <parameter list> )
```

### Description

Pads are created by drawing a line, with a specified thickness, between two points. The line is drawn with a square nib and extends beyond each end point by a distance of  $\frac{\text{thickness}}{2}$ .

Parameter Name	Default Value	Notes
x1		X coordinate of the first point.
y1		Y coordinate of the first point.
x2		X coordinate of the second point.
y2		Y coordinate of the second point.
thickness		Width of the line.
clearance		separation of pad from other conductors on the layer .
mask		distance between the edge of the solder mask and the copper pad. This definition differs fromthe <b>PCB</b> definition of mask.
name		Identification string for the pad
pad_number		The pin number of the component that will reside on the pad.
flags		See <a href="#">Table 17</a>

Table 6: Keys for Method element\_add\_line

### Example

To create a pad that is centered at (0,0) that is 100 mils long and 50 mils thick has a soldermask clearance of 10 mils, a copper clearance of 9 mils and is numbered one:

```
$Pcb -> element_add_pad(x1 => -25, y1 => 0,  
                        x2 => 25, y2 => 0,  
                        thickness => 50,  
                        mask => 10,  
                        clearance => 9,  
                        pad_number => 1);

## 9 element\_add\_pad\_rectangle

### Usage

```
Pcb->element_add_pad_rectangle( <parameter list> )
```

### Description

Create a pad with a specified width and length that is centered at a point (x,y). The length is in x-direction and the width is in the y-direction.

Parameter Name	Default Value	Notes
x		X coordinate of the point.
y		Y coordinate of the point.
width		The pad width (y direction)
length		The pad length (x direction)
clearance		separation of pad from other conductors on the layer .
mask		distance between the edge of the solder mask and the copper pad. This definition differs fromthe <b>PCB</b> definition of mask.
name		Identification string for the pad
pin_number		The pin number of the component pin that will inserted at this position.

## 10 element\_add\_pin\_oval

### Usage

```
Pcb->element_add_pin_oval( <parameter list> )
```

### Description

Create a pad with a specified width and length that is centered at a point (x,y). The length is in x-direction and the width is in the y-direction. The corners of the pad are rounded.

This is actually a hybrid object consisting of a component side pad, a solder side pad and a pin placed at the same center point.

Parameter Name	Default Value	Notes
x		X coordinate of the point.
y		Y coordinate of the point.
width		The pad width (y direction)
length		The pad length (x direction)
drill_hole		diameter of the hole that is drilled at the center of the pad
name		Identification string for the pad
pin_number		The pin number of the component pin that will inserted at this position.

Table 8: Keys for Method element\_add\_pin\_oval

### Example

To place a pin with an oval pad at (-100,0) with a pad diameter of 55 mils, a drill hole diameter of 35 mils, soldermask clearance of 10 mils, a copper clearance of 9 mils, and a pin number of one:

```
$Pcb -> element_add_pin_oval(x => -100, y => 0,  
                             thickness => 55,  
                             drill_hole => 35,  
                             mask => 10,  
                             clearance => 9,  
                             pin_number => 1);

## 11 element\_add\_mark

### Usage

```
Pcb->element_add_mark( parameter list )
```

### Description

The mark is a positioning hint. `element_add_mark` places the mark at at a point (x1, y1).

Parameter Name	Default Value	Notes
x		X coordinate of the point.
y		Y coordinate of the point.

### Usage

Pcb->element\_add\_lines( *(parameter list)* )

### Description

Draws silkscreen lines using the specified line end points. Lines are drawn from point to point until all the points are connected.

Parameter Name	Default Value	Notes
points		reference to a list containing x,y coordinates for line end points.
thickness		Width of the line.

## 13 element\_add\_rectangle

### Usage

Pcb->element\_add\_rectangle( *<parameter list>* )

### Description

Draws a silkscreen rectangle with a specified **width** and **length** at a point (x1, y1).

Parameter Name	Default Value	Notes
x		X coordinate of the point.
y		Y coordinate of the point.
width		rectangle width (y direction)
length		rectangle length (x direction)
thickness		Width of the line.

## 14 element\_set\_text\_xy

### Usage

Pcb->element\_set\_text\_xy( *<parameter list>* )

### Description

Sets the position of the reference designator text.

Parameter Name	Default Value	Notes
x		X coordinate of the point.
y		Y coordinate of the point.
font_size

## 15 element\_set

### Usage

```
Pcb->element_set( parameter list )
```

### Description

Sets values in the element hash table. This should be the only method used to set values in the element hash. *parameter list* contains key-value pairs.

## 16 element\_get

### Usage

```
Pcb->element_get( parameter list )
```

### Description

Returns a value, from the element hash, for each key specified in *parameter list*. If the value is undefined in the element hash then a value from the Pcb object hash is returned. A value of **undef** is returned if neither hash contains a defined value for the key.

This should be the only method used to retrieve values from the element hash. *parameter list* contains a list of keys.

## 18 element\_dump

### Usage

```
Pcb->element_dump( <parameter list> )
```

### Description

A debugging procedure that Prints out the element command drawing commands to STDOUT.

## 19 Change Log

Pcb_9	???	jcl	<ol style="list-style-type: none"><li>1. Fixed a dimension scaling bug in <code>element_add_lines</code>. The scaling routine now scales an array of points. This bug was reported by Ben Jackson.</li><li>2. The scaling routines now accept a dimension suffix which will override the default dimension.</li></ol>
Pcb_8	19-Mar-2007	jcl	<ol style="list-style-type: none"><li>1. Removed the export of <code>element_add_arc</code>. Not necessary (OO).</li><li>2. Corrected the mask and clearance parameters in the <code>pin</code>, <code>pad</code> and <code>pin_oval</code> procedures.</li><li>3. Removed the <code>Mark</code> command since the mark data is now in the Element header.</li><li>4. Exported <code>element_str</code> and added a <code>scale_factor</code> parameter (default value of 100)</li><li>5. the key to specify dimensional units (<code>input_dim</code>) was changed to <code>dim</code></li><li>6. Fixed the dimension scaling problem in <code>add_element_lines</code></li><li>7. Corrected the documentation for <code>element_add_pin_oval</code></li></ol>
Pcb_7	25 March 2005	jcl	<ol style="list-style-type: none"><li>1. changed the definition of the mask and clearance.</li><li>2. Fixed the mask and clearance parameters in the <code>pin</code>, <code>pad</code> and <code>pin_oval</code> procedures.</li></ol>
Pcb_6	22 March 2005	jcl	<ol style="list-style-type: none"><li>1. The <code>element_add_rectangle</code> command now uses the <code>x</code> and <code>y</code> parameters. The center of the rectangle was always placed at (0,0)</li><li>2. The <code>pin_one_square</code> key-value pair was not getting properly tested in the <code>element_add_pin</code> procedure.</li><li>3. Added the <code>clearance</code> and the <code>mask</code> parameters to <code>element_add_pad_rectangle</code>.</li></ol>
Pcb_5	6 March 2005	jcl	<ol style="list-style-type: none"><li>1. Added the <code>element_add_lines</code> command.</li><li>2. added the <code>element_add_pin_oval</code> command.</li><li>3. Modified the debug print messages.</li><li>4. Fixed constant for octagonal pads.</li><li>5. Fixed errors in the <code>EXPORT_OK</code> and <code>EXPORT_TAGS</code> declarations.</li><li>6. Added <code>element_get_names</code>.</li></ol>
Pcb_4	27 February 2005	jcl	<ol style="list-style-type: none"><li>1. Modified the debug strings to output mm and mils.</li><li>2. Fixed the <code>scale_factor</code> subroutine. <code>scale_factor</code> did not correctly convert from mils to mm. I did not test (or use) the conversion to mm until I modified the debug strings</li></ol>
Pcb_3	7 February 2005	jcl	Initial Release

## 20 Element Flags

The element flag field determines the state of an element. The bit values are:

Parameter Name	Default Value	Notes
ELEMENT_NAME_HIDDEN	0x10	bit 4: the element name is hidden
ELEMENT_SELECTED	0x40	bit 6: element has been selected
ELEMENT_SOLDER_SIDE	0x80	bit 7: element is located on the solder side

249 # Style (adapted from the Perl Cookbook, First Edition, Recipe 12.4)
250
251 # 1. Names of functions and local variables are all lowercase.

```

Navigation buttons: Home, Full Screen, Close, Quit

```
252 # 2. The program's persistent variables (either file lexicals
253 # or package globals) are capitalized.
254 # 3. Identifiers with multiple words have each of these
255 # separated by an underscore to make it easier to read.
256 # 4. Constants are all uppercase.
257 # 5. If the arrow operator (->) is followed by either a
258 # method name or a variable containing a method name then
259 # there is a space before and after the operator.
```
